TITLE: Investigation of the corrosion of aluminum in water at high temperatures

SOURCE: Moscow. Gosudarstvennyy nauchno-issledovatel'skiy i proyektnyy institut splavov i obrabotki tsvetnykh metallov. Trudy, no. 24, 1965. Metallovedeniye i obrabotka tsvetnykh metallov i splavov (Metal science and the treatment of non-ferrous metals and alloys), 102-123

TOPIC TAGS: aluminum, aluminum compound, corrosion, corrosion rate, intergranular corrosion/ A00 aluminum

ABSTRACT: It was the object of this investigation to resolve the existing controversy concerning the mechanism of the corrosion reaction of aluminum in water at high temperatures, as discussed by V. H. Trautner (Corrosion, 1959, v. 15, No. 1,

Card 1/3

L 24435-66

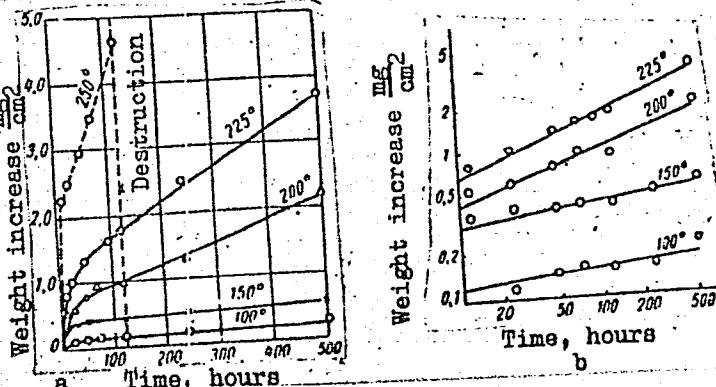

ACC NR: AT6006478

p. 17) and W. J. Bernard and J. J. Randall (Journ. Electrochem. Soc., 1961, v. 108, No. 9, p. 822). The experiments were carried out in steel autoclaves with aluminum specimens of A00 (99.9% Al) type aluminum and distilled water ($\text{pH } 5.5 \sim 6.3$) over the temperature range of 100--250°C. The experimental results followed the relationship

$$\lg \Delta p = n \lg t + \lg k$$

where Δp is the weight increase of the specimen in mg/cm^2 , t - the time in hours, and k and n are constants. These results are presented graphically (see Fig. 1).

Fig. 1. Kinetics of aluminum oxidation in water at high temperatures. a - linear coordinates; b - logarithmic coordinates.

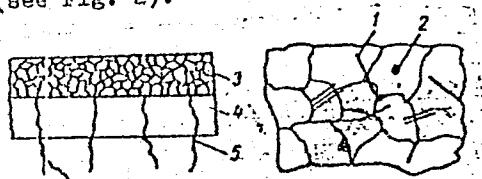

Card 2/3

L 24435-66
ACC NR: AT6006478

The morphology of the corrosion products was studied. Electron microscope pictures of the corrosion products are presented. The phase composition of the corrosion products was investigated by x-ray diffraction and electron diffraction techniques, and the results are also presented in tables and graphs. A scheme for the distribution of corrosion products is proposed (see Fig. 2). ¹⁸

Fig. 2. Scheme for the distribution of products based on the experimental data. 1 - σ phase; 2 - diasporite; 3 - crystal layer; 4 - optically structureless layer; 5 - products of inter-crystalline corrosion.

It is concluded that the experimental results support the mechanism proposed by Trautner (see reference above). The authors suggest that the rate of hydrogen ion diffusion into the metal depends on a number of factors, e.g., phase composition, size, form, and degree of perfection and optimum orientation of crystals. Orig. art. has: 5 tables, 10 graphs, and 2 equations.

Obrabotka detaley mashin na rastochnykh stankakh (Processing of
Machine Parts on Boring Machines) Moscow, Mashgiz, 1958. 339 p.
12,000 copies printed.

Ed.: Oglodulin, A.N., Docent; Reviewer: Kucher, I.M., Candidate of
Technical Sciences; Ed. of Publishing House: Leykina, T.L.;
Tech. Ed.: Sokolova, L.V.; Managing Ed. for literature on the
technology of machine building of the Leningrad Branch of
Mashgiz: Naumov, Ye.P., Engineer.

PURPOSE: This book is recommended as a text for technical schools.
It is intended also for boring-machine operators in machine-
building plants specializing in individual and limited series
production.

Card 1/7

Processing of Machine Parts on Boring Machines

531

COVERAGE: The textbook reviews designs of the most widely used boring machines and explains various aspects of machining piece parts under conditions of individual and limited series production. Examples of machining frame parts with and without the aid of jigs are cited as well as examples of special operations performed on boring machines. Special cutting tools, measuring instruments, and auxiliary tools employed in boring operations are described. Measures for increasing the productive capacity of boring machines and for improving the quality of machining are reviewed. The task of preparing the textbook was apportioned as follows: I.V. Asmus prepared Chapter IV; I.I. Verin, Chapter I; D.G. Gol'tsiker, Chapter II; L.B. Krasnov, Chapter V, VI, and VII and paragraphs 49, 50, and 51 of Chapter VIII; M.E. Tsyplkin, Chapter III, paragraph 13 of Chapter IV, paragraph 27 of Chapter V, paragraph 40 of Chapter VI, paragraph 41 of Chapter VII, paragraphs 46, 47, 48, and 51 of Chapter VIII, and Chapter IX. The authors, in compiling the textbook, drew on the experience of the Leningrad Machine-tool Building Plant imeni Sverdlov and the Kramatorsk Plant for heavy machine tools. There are 7 Soviet references.

AUTHOR: Tsypkin, S.I.
TITLE: Some Non-Steady Phenomena in the Peltier Effect
PERIODICAL: Tr. Leningr. tekhnol. in-t kholodil'n prom-sti, 1958, Vol 15, p 224
ABSTRACT: The author considers briefly the problem of correlating with time (t) the temperature (t) of the cold junction between two semiconductors through which a current is passing. He submits the results of solving this problem (by the operational method) for the case of a thin semi-limited rod with continuously distributed sources of Joule heat, removal of Peltier heat through the butt boundary, and heat exchange with the surrounding medium through the lateral surface. It follows from the general solution that when $\tau = \infty$, the optimum magnitude of the steady temperature depends only on $z = \alpha^2 \sigma / 4 \lambda$ (α is the thermo-emf, σ and λ are the specific electric and thermal conductivities respectively of the circuit materials). Expansion of the solution into a series shows that $(t(0T))$ has a minimum at all practically essential values of z . In the event of not too weak

 AUTHOR:
 TITLE: A Conference on Electrical Food Processing Methods
 (Konferentsiya po elektricheskim metodam obrabotki
 plahoderykh produktov)

PERIODICAL: Izvestiya vuzovskikh uchebnykh zavedenii - Radiotekhnika
 i elektronika, 1959, Vol. 2, No. 1, pp. 120-121 (USSR)

ABSTRACT: A conference on electrical food processing methods was held in Kiev from 7 to 13 October 1958. The conference was organized by the Kyiv Scientific Research Institute of Technology of the Food Industry (Kievskiy Institut Plahoderykh proizvodstvennoy tekhniki UZHRS). The conference comprised a wide range of problems and the novelty of the subjects caused great interest of work and industrial applications. From scientific institutions and industrial installations, the 350 delegantes came from 60 towns of the USSR; 119 participants were sent to the conference from various and more than 50 research institutes. At the conference, dealing with problems of applying electrofriction, electric fields, direct current, infrared and ultraviolet radiation, frequency current, low frequency current, high voltage, X-ray and gamma radiation for processing food products. Also statements were made concerning the application of ultrasound oscillations in the food industry. Considerable attention was devoted to the application of UVC (ultraviolet) to destroy - high frequency current) for technological purposes particularly for processing non-conductive materials in an electric high frequency field. More than 20 reports and statements were delivered on this subject, dealing with theoretical and technological problems. For example: "The Electrical Properties of Some Food Products in High Frequency Fields" by S.M. Andreyev, V.M. Kudin, V.L. Boukhil (Moscow); "Active Losses in Food Products" by L.S. Polikarpov (Kiev); "The Electrical Properties of Confiture by Yu.E. Rezhitskiy (Leningrad); "A Continuous Automatic High Frequency Sterilizer for the Sterilization of Fruit Conerves on Conveyer" by M.D. Chernavskiy (Novosibirsk); "The Drying of Spiced Sprouts by High Frequency Current" by V.M. Podeshevskiy (Moscow); "The High Frequency Boiling of Marmalade" by M.B. Belobogov (Leningrad); "The High Frequency Boiling of Electrically Moted Fish" by A.I. and A.L. Kalitina and I.S. Park (Kiev); "The Technological Peculiarities of Processing Sauerkraut Products by High Frequency Currents" by L.D. Shchukina (Nizhny Novgorod). At this conference, following reports were heard with great interest and were discussed in detail. The Application of Infrared Heating for Drying of Confectionery Products by M.M. Belobogov (Leningrad); "The Technological Principles of the Hot Electrical Fish Smoker" by A.I. and A.L. Kalitina and I.S. Park (Kiev); "The Processing of New Fish Processing Technology and the Processing of Canning and Sprats With the Application of Infrared Light and Smoking Liquids" by I.I. Lazebnik (Moscow); "The VNIKOF Experimental Plant for Ionization Processing of Food Products" by L.D. Chernavskiy (Moscow); and "An Investigation of the Possible Application of Radioactive Radiation for Preserving the Albuminous Radish, Radish, and Turnip" by S.I. Tsyplkin (Leningrad).

steady-state processes in pulse networks, specifically, in linear electric circuits and mechanical systems with pulse input. The developed theory is applied to the study of intermittent and relay-type control systems.

The book is primarily theoretical in nature. The discussion revolves around a simple and comprehensive method of analysis and computation, illustrated with specific characteristic examples with a full complement of formulas and graphs.

Table of Contents:

- Ch. 1 Elements of Laplace's Transforms.
- 2 Pulse Networks.
- 3 Pulse Feedback Systems.
- 4 Relay Feedback Systems.

Purpose: Intended for scientists, candidates for academic degrees, and research engineers working in the fields of electrical and radio engineering, and automatics.

Facilities: Not given

No. of Russian and Slavic References: 47 (of these, 10 are non-Soviet)

TSYPKIN, YA. S

Tsyplkin, Ya. S. defended his Doctor's dissertation in the Institute of Automatics and Telemechanics, Academy of Sciences USSR on 6 February 1943, for the academic degree of Doctor of Technical Sciences.

Dissertation: "Systems with Delayed Feedback". Resume: Tsypkin examined systems with delayed feedback, developed stability criteria and methods for investigating the degree of stability and constructed transient and forced processes for linear systems. Methods were also developed for investigating self-induced oscillations in nonlinear systems. The methods were used for analysis and calculation of systems for automatic regulation of pressure and temperature of a servo system, an aircraft automatic pilot, ultra-short-wave generators, klystrons, systems with distributed parameters, and others. The theory described is applicable to analysis and calculation of complex systems with lumped parameters, which can be approximately replaced by simple equivalent systems.

TSYPKIN, YA. Z.

"Stability of Periodic Operating Conditions in Relay Systems of Automatic Regulation", Avtomatika i Telemekhanika, Vol 14, No 5, 1953, pp 638-646.

Analyzes a relay system, consisting of a linear element and a relay element, the characteristic of which is $u_p = \phi(u_{BX})$ (u_p, u_{BX} -- output and input coordinates of the relay) acquires the values \bar{u}_p .

The linear part of the system may contain lumped and distributed parameters. The external periodic reaction is coupled to the input of the relay element.

Considering the simplest periodic operating condition $u_{BX}, T(t), T = \bar{T}/w_0$ as determined, the author solves the problem of its stability. The equation of variations is written in the form

$$Q(D) \xi(t) = P(D) \xi_1(t) \quad (D = \frac{d}{dt}) \quad (1)$$

Here $Q(D), P(D)$ are polynomial or transcendent functions

$$\varepsilon_1(t) = -\frac{2K_u}{\bar{u}_{Bx,T}(t)} \sum_{m=0}^{\infty} s(t-mT) \varepsilon(mT)$$

The prime in the summation sign means that for $m = 0$ the term is multiplied by $\frac{1}{2}$.

It may be considered that the equation (1) corresponds to the system of intermittent regulation, in which the linear part of the system coincides with the linear part of the relay system, and the pulse element is characterized by a recurrent period equal to the half period T , infinitely small porosity and amplification factor

$$\bar{K}_u = \frac{2K_u}{\bar{u}_{Bx,T}(t)}$$

Hence the investigation of stability of a periodic operating condition in the relay system leads to the investigation of the stability of a certain system of intermittent regulation. The fact of stability (instability) of the system of intermittent regulation is established by means of well-known criteria. (RZhMekh, No 11, 1954)

FD-2759

Card 1/2 Pub. 10 - 4/11

Author : Tsyplkin, Ya. Z. (Moscow)

Title : Taking into account the form of pulses in systems of discontinuous regulation

Periodical : Avtom. i telem., 16, Sep-Oct 1955, 462-466

Abstract : The author shows that the theory expounded earlier by him ("Theory of discontinuous regulation. I, II, III," ibid., 10, Nos 3 and 5, 1949; 11, No 5, 1950. "Frequency method of analyzing systems of discontinuous regulation," ibid., 14, No 1, 1953) is applicable also to systems of discontinuous regulation of the first type which are characterized by the fact that the output quantity of pulse element is represented as a sequence of pulses of arbitrary form which are equidistant from one another. Title: On the Connection Between the Equivalent Amplification Coefficient
of a Nonlinear Element and Its Characteristic

Original
Periodical: Avtomatika i telemekhanika, 1956, 17, No 4, 343-346

Abstract: An explicit relationship is derived between the equivalent complex
amplification coefficient ("average transconductance") $S(A)$ and the
characteristic of a nonlinear element $F(x_1)$. For a symmetrical
characteristic, an approximate equation was obtained

$S(A) = \frac{2}{3A} \left[F(A) + F\left(\frac{A}{2}\right) \right]$, which was illustrated by a graph for cases
of typical $F(x)$. More exact equations are also given for $S(A)$, as
well as tables with the values $S(A, w)$ for certain nonsymmetrical
characteristics, and a graphic method for obtaining $S(A)$ directly

Abst Journal: Referat Zhur - Fizika, No 12, 1956, 35237

Abstract: from the $F(x)_1$ curve is indicated. All the results are obtained using V. A. Steklov's method for calculating the integral.

$$SA = \frac{2}{\pi A} \int_1^{\pi} F(A \cos \psi) \cos \psi d\psi = \frac{2}{\pi A} \int_{-1}^{1} \frac{F(Ay)y}{\sqrt{1-y^2}} dy, \text{ where } y = \cos \psi.$$

"Investigation of Steady-State Processes in Pulse Servosystems," by Ya. Z. Tsypkin, Moscow, Avtomatika i Telemekhanika, Vol 17, No 12, Dec 56, pp 1057-1069

The author presents an expression for the steady-state error of pulse systems. He describes various methods for computing error coefficients and investigates a steady-state process in the simplest pulse servosystem.

"Pulse servosystems are widely used in pulse engineering, radio location, and computer engineering."

ABSTRACT: A study is made of the problem of calculating approximately the time characteristics of closed linear systems by using transfer functions or using the time characteristics of the systems' individual components. According to the well-known formula of the theory of impulse control systems, a transition is accomplished from the continuous transfer function to a discrete transfer function. The relationship between the discrete values of the output and input values in a continuous system is written as a summation (the discrete weight function). The weight factors of this summation are equal to the coefficients of the expansion into a series of the discrete
